Supplementary Specification

1. Introduction

The present document constitutes an overview for non-functional requirements of the project, such as: Availability, Performance, Security, Testability and also the design requirements of the project.

2. Non-functional Requirements

2.1 Availability

The application can be accessed at any time of the day.

2.2 Performance

We want to design an application as performant as possible, therefore it must have fast database access and support for multiple clients.

2.3 Security

A visitor who will want to have access at more information will have to create an account with some password constraints, also none of the users can access admin information.

2.4 Testability

The application will require a number of tests for CRUD operations, before it can be given into functionality.

2.5 Usability

The application will provide an interactive and easy to use interface.

3. Design Constraints

[This section needs to indicate any design constraints on the system being built. Design constraints represent design decisions that have been mandated and must be adhered to. Examples include software languages, software process requirements, prescribed use of developmental tools, architectural and design constraints, purchased components, class libraries, and so on.]
